What if one day you woke up and went to turn on a faucet, and nothing came out? In some places this is already happening, and if we don't do anything soon it could happen in more places. Did you know that 99% of earth's water isn't safe to drink? There is 326 million trillion gallons of water on earth. (USGS, 2018).

There are many good ways to save water and not waste it. One of the best ways to save water is by not littering, because water won't get polluted if there is no trash to pollute it. Some ways to use water include taking shorter showers instead of baths. You can also store rainwater to water a garden. One last thing you can do is turn the faucet off when you are not using it.

Most freshwater is in ice glaciers. Our bodies are 60% water. Did you know that the reason water is called H_2O is
